

UNIGROUT

PATENTED TECHNOLOGY

GROUT IMITATING TECHNOLOGY FOR RIGID FLOORS

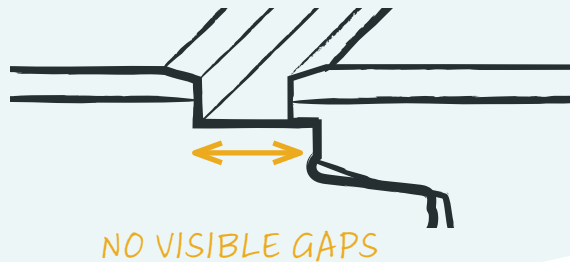

Unigrout is a specially designed bevel technology for the edges of rigid tiles that looks exactly like a grouted groove and which is **almost indistinguishable from real grout**. With the overlapping area underneath the bevel, floor panels can move or expand without showing unwanted gaps.

LOOK AND FEEL OF REAL GROUT

WHY CHOOSE UNIGROUT?

Unigrout provides a level installation with equal grout lines. This patented technology is specifically designed to **minimize the risk of visible gaps between two panels.** Even when floor panels would expand or shrink due to changes in temperature, the specifically **designed system will prevent visible gaps** by using a telescopic ability of the innovative joint, wherein the upper edges maintain an overlapping geometry even when distanced due to shrinking.

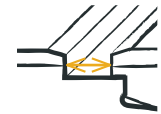

NO NEED TO GROUT

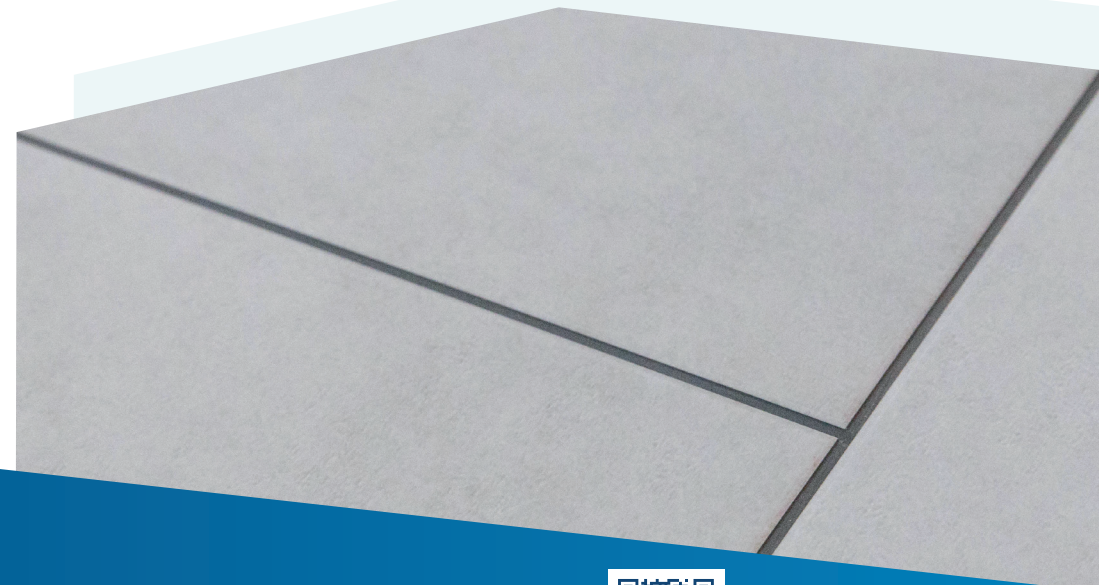

NO SHARP EDGES

PERFECT CERAMIC IMITATION

DIFFERENT BEVEL WIDTHS POSSIBLE
